

Ontology AI Ethical Assessment

Project: AI System · Generated: 23.07.2026

RISK SCORE

43/100

Higher = riskier

Limited Risk

DIMENSION BREAKDOWN

EXECUTIVE SUMMARY

The selected project is understood as an education-context student wellbeing decision-support system. It generates an individual risk score, so prioritization, profiling, and fairness risks require evidence-based review. Medical diagnosis is explicitly excluded and is not used to add clinical diagnosis risks. Human review and override are confirmed safeguards and reduce automation risk. Legal basis and explicit or informed consent are confirmed and preserved across turns. The current explainable score is 43/100, where higher means higher residual risk.

ETHICAL TENSIONS

RECOMMENDATIONS

- Document data retention, access control, security, and minimization evidence for each data source.
- Validate the stress risk score for false positives, false negatives, and bias across student groups.
- Keep counselor review and override as a mandatory control for intervention prioritization.
- Keep consent, withdrawal, and non-penalty language visible to students before data collection.
- Define a review or appeal path for students affected by prioritization.
